Scan for more details

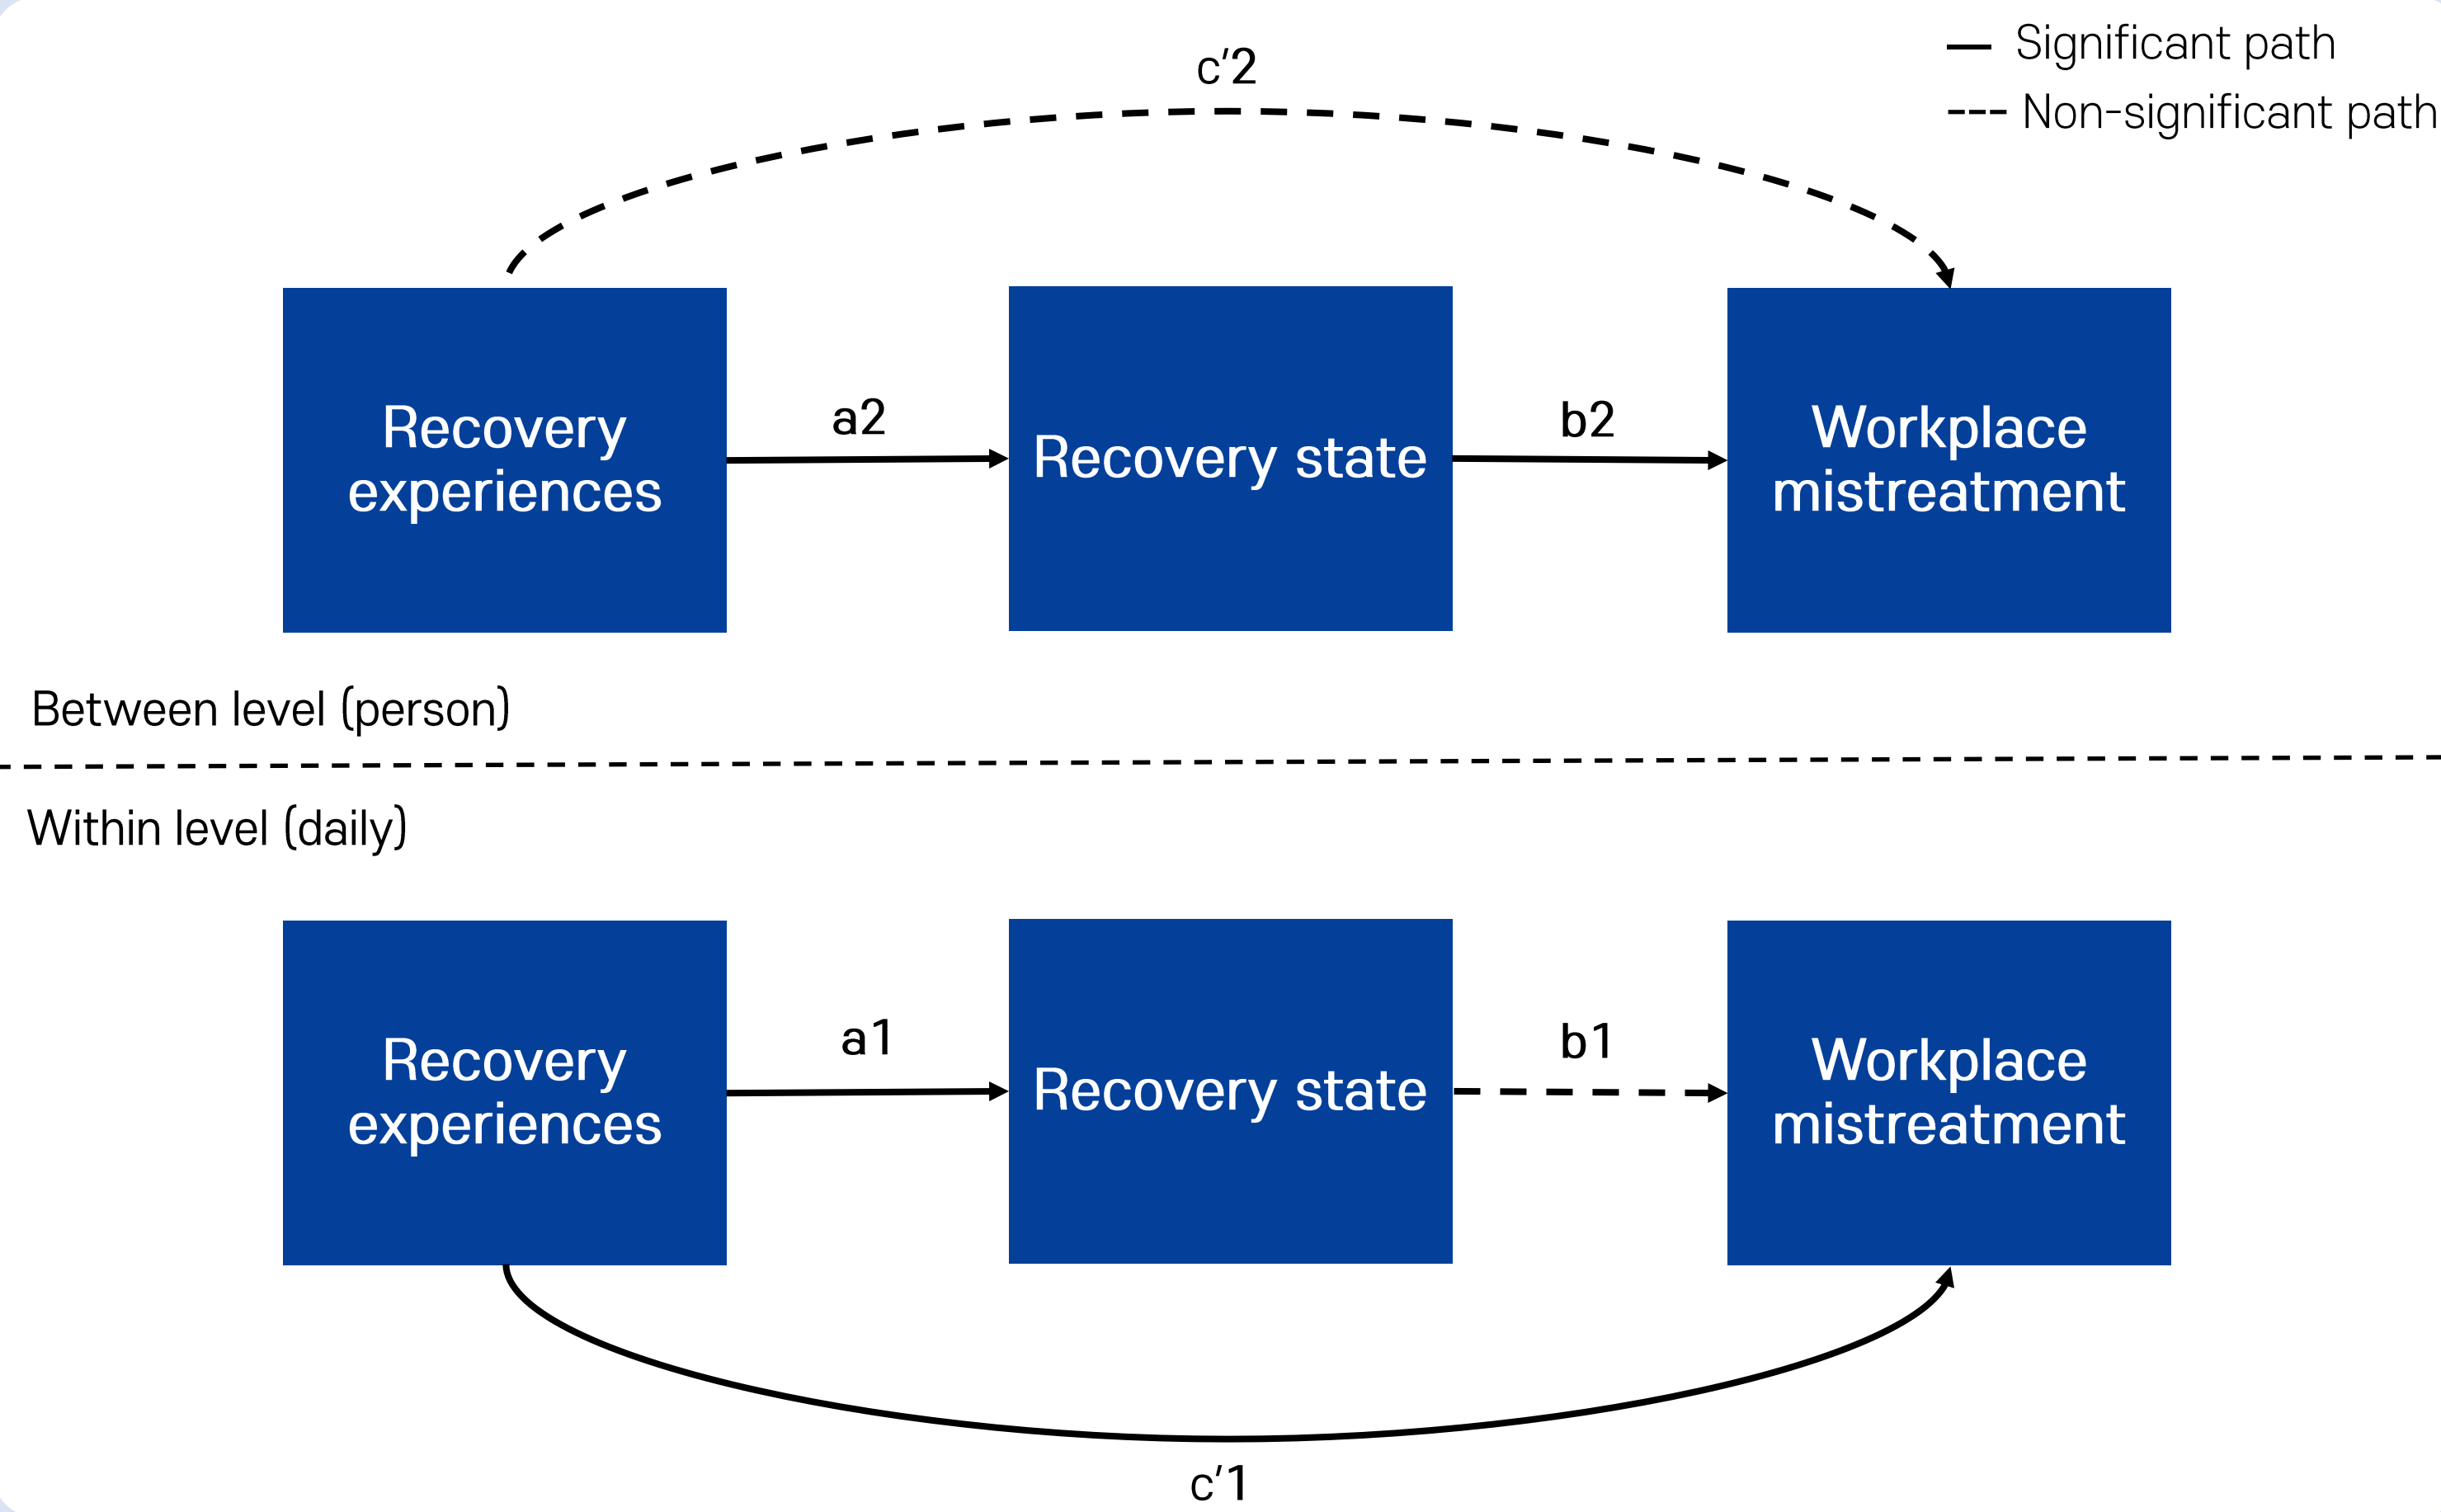

"The *accumulation of recovery experiences* builds *psychological resources* that protect nurses from perceiving negative workplace interactions as *mistreatment*."

01 BACKGROUND

- Workplace mistreatment is a prevalent interpersonal stressor and a significant source of strain for employees.
- Employees' psychological resources influence how they perceive and interpret potentially negative workplace interactions .
- Sufficient psychological resources enable employees to appraise ambiguous interpersonal behaviors more objectively and feel less threatened.
- Effective recovery is a key mechanism for replenishing psychological resources.
- The present study tests whether recovery experiences enhance recovery state, which in turn reduces perceptions of workplace mistreatment at both the daily and person levels.

02 CONCEPTUAL MODEL

03 METHOD

- **Participants**
 - 268 registered nurses employed at hospitals in South Korea.
- **Procedure**
 - Using experience sampling methodology, daily surveys were conducted on each workday over one month, consisting of a post-work survey and a next-morning survey.
 - A total of 3,917 daily observations were obtained ($M = 14.6$ days per person).
- **Measures**
 - Recovery experiences: 4 items (psychological detachment, relaxation, mastery, control)
 - Recovery state: 2 items
 - Workplace mistreatment: 10 items (patients/caregivers: 4 items; supervisor: 3 items; coworker: 3 items)
- **Analysis**
 - Multilevel structural equation modeling using Mplus 8.9.

04 RESULTS

Path	Estimate	SE	95% CI
Within level (daily)			
Recovery experiences → Recovery state (a1)	.505***	.013	[.480, .530]
Recovery state → Mistreatment (b1)	.023	.018	[-.012, .059]
Indirect effect (a1 × b1)	.060	.046	[-.030, .149]
Recovery experiences → Mistreatment (c'1)	-.043*	.019	[-.080, -.006]
Between level (person)			
Recovery experiences → Recovery state (a2)	.692***	.036	[.621, .763]
Recovery state → Mistreatment (b2)	-.196*	.090	[-.371, -.020]
Indirect effect (a2 × b2)	-1.413*	.661	[-2.708, -.118]
Recovery experiences → Mistreatment (c'2)	.061	.090	[-.116, .237]

Note. β = standardized coefficient (STDYX). Indirect effects are unstandardized. CI = 95% confidence interval. * $p < .05$. *** $p < .001$.

05 DISCUSSION

- At the person level, recovery experiences reduced perceived workplace mistreatment through recovery state, whereas this indirect effect was not significant at the daily level.
- This suggests that daily fluctuations in recovery may not immediately influence perceptions of workplace mistreatment; rather, it is the accumulation of recovery experiences over time that shapes how employees perceive negative workplace interactions.
- These findings highlight the importance of fostering a work environment that consistently supports nurses' recovery to reduce their perceptions of workplace mistreatment.
